

SYNERGISTIC PROJECT

Using Linked Models to Predict the Impacts of Hypoxia on Gulf Coast Fisheries under Scenarios of Watershed and River Management

Kenneth Rose¹
LSU

Workshop: Hypoxia effects on fish and fisheries:
kick-off meeting of decision support tool
development

February 6, 2016

¹After June 1: Horn Point Lab, Univ. of Maryland Center for Environmental Science

Today

- Brief overview of NGOMEX project
- Synergistic project to the host project of this workshop
- PIs want to leverage the workshop and the results of the projects through coordination and collaboration
 - Same questions
 - Complementary approaches
 - Shared scenarios
 - Similar format of advice to management

Does hypoxia have population level effects on coastal fish?

- Much evidence for hypoxia effects on individuals
- Less conclusive evidence for population-level effects
- Multiple stressors, high variability, and density-dependence make detection difficult
- Need for population studies that quantify exposure and separate hypoxia effects from other stressors

Rose et. al. 2009. "Musings from the virtual world". J Exp Mar Biol Ecol

People

People	Role	Responsibilities	Tasks
Justic	Co-PI	Program coordination; FVCOM and WASP	4,5,12,14
Rose	Project PI	Program coordination; population models; communication	7,8,9,14
Craig	Application PI	Management Committee; communication; population models	10,14
Huang	Co-PI	Coupling of FVCOM and population models	6,15
Tian	Co-PI	DLEM; land-use scenarios; future scenarios	1,2,16
Meselhe	Co-PI	Delft3D; estuarine fluxes; diversion scenarios	1,2,3
Xue	Co-PI	Model linkages; high performance computing	11,13

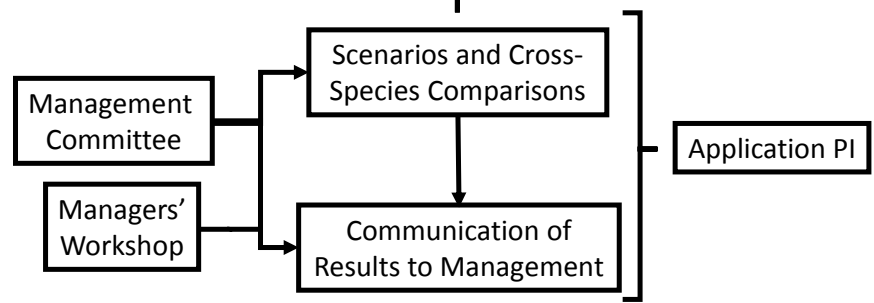

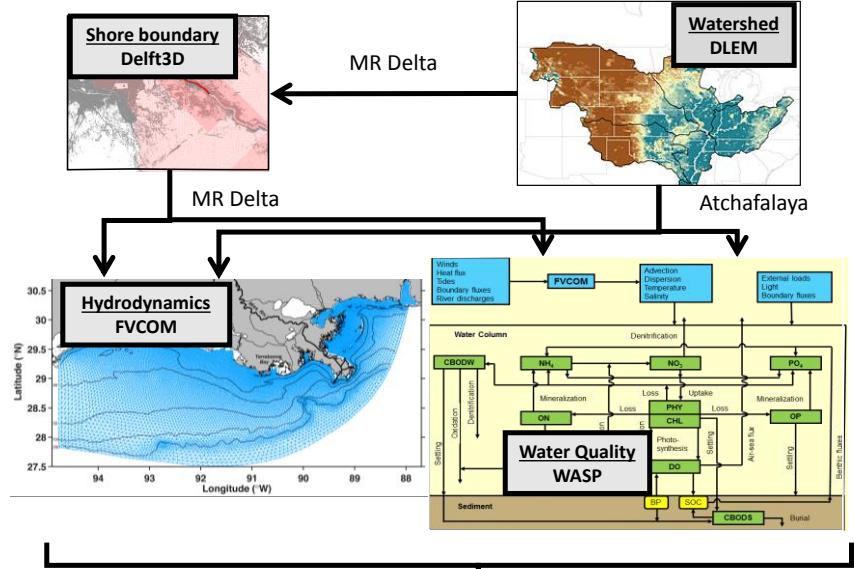

Guiding Questions

- ***How do nutrient loadings and diversion operations affect hypoxia?***
- ***What are defensible estimates of the population-level abundance changes in response to watershed management and diversion operations effects on hypoxia and food?***
- ***What is the sensitivity of predicted responses under interannual variation and under possible future conditions?***

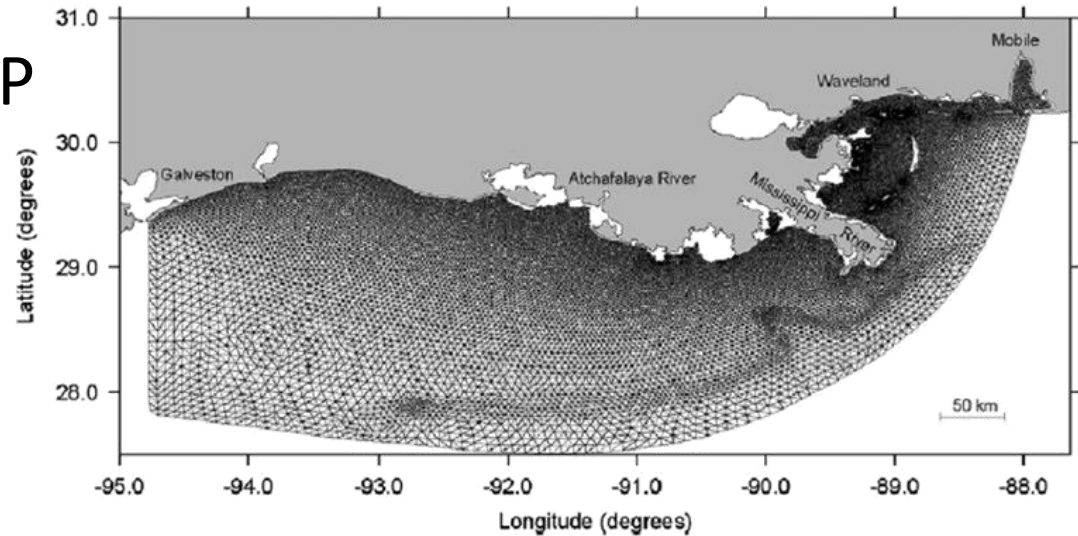

Guiding Questions

- ***What are the relative contributions of reduced nutrient loadings (food), diversions, and hypoxia to the overall fish and shrimp population level responses?***
- ***What are some possible watershed management scenarios that feasibly lead to the hypoxia reductions deemed desirable based on the simulated population responses?***

Dissolved Oxygen

- 3-D FVCOM/WASP
- Calibrated and assessed using multiple independent data sources for 2002

Example from Prior Project

- Previously, we simulated hypoxia effects on croaker at the population level
- We used separate 2-D grid with input data from multiple sources (FVCOM, climatological, ROMS)
- Now, we will use consistent, seamless inputs by simulating fish in 3-D within the FVCOM grid
 - Watershed management
 - Diversions
- Expand to shrimp, menhaden, and red snapper
- Example of what results will look like

Modeling Strategy

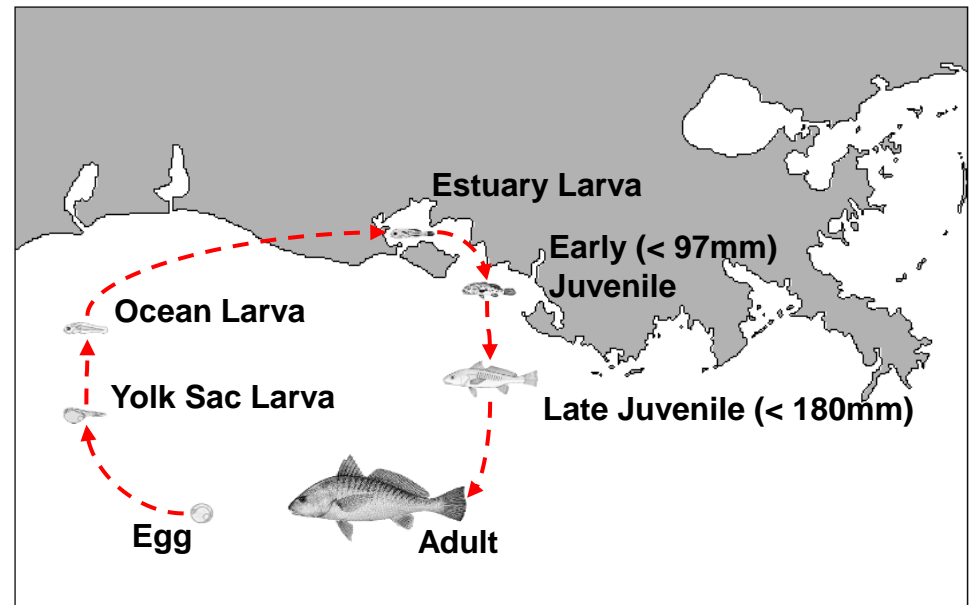

- Individual-based population model
- Exposure determined by movement
- Effects determined by lab experiments and field data applied to growth, mortality, and reproduction
- Strategy:
 - Build-up with a solid and credible empirical basis
 - Ability to keep things constant
 - No explicit food web interactions

Model Overview

- Spatially explicit, IBM
 - Follows 7 stages to age 8
 - September 1 birthday
 - Model year begins Sept. 1
 - Each year 365 days long

- Hourly processes
 - Growth
 - Mortality
 - Reproduction
 - Movement

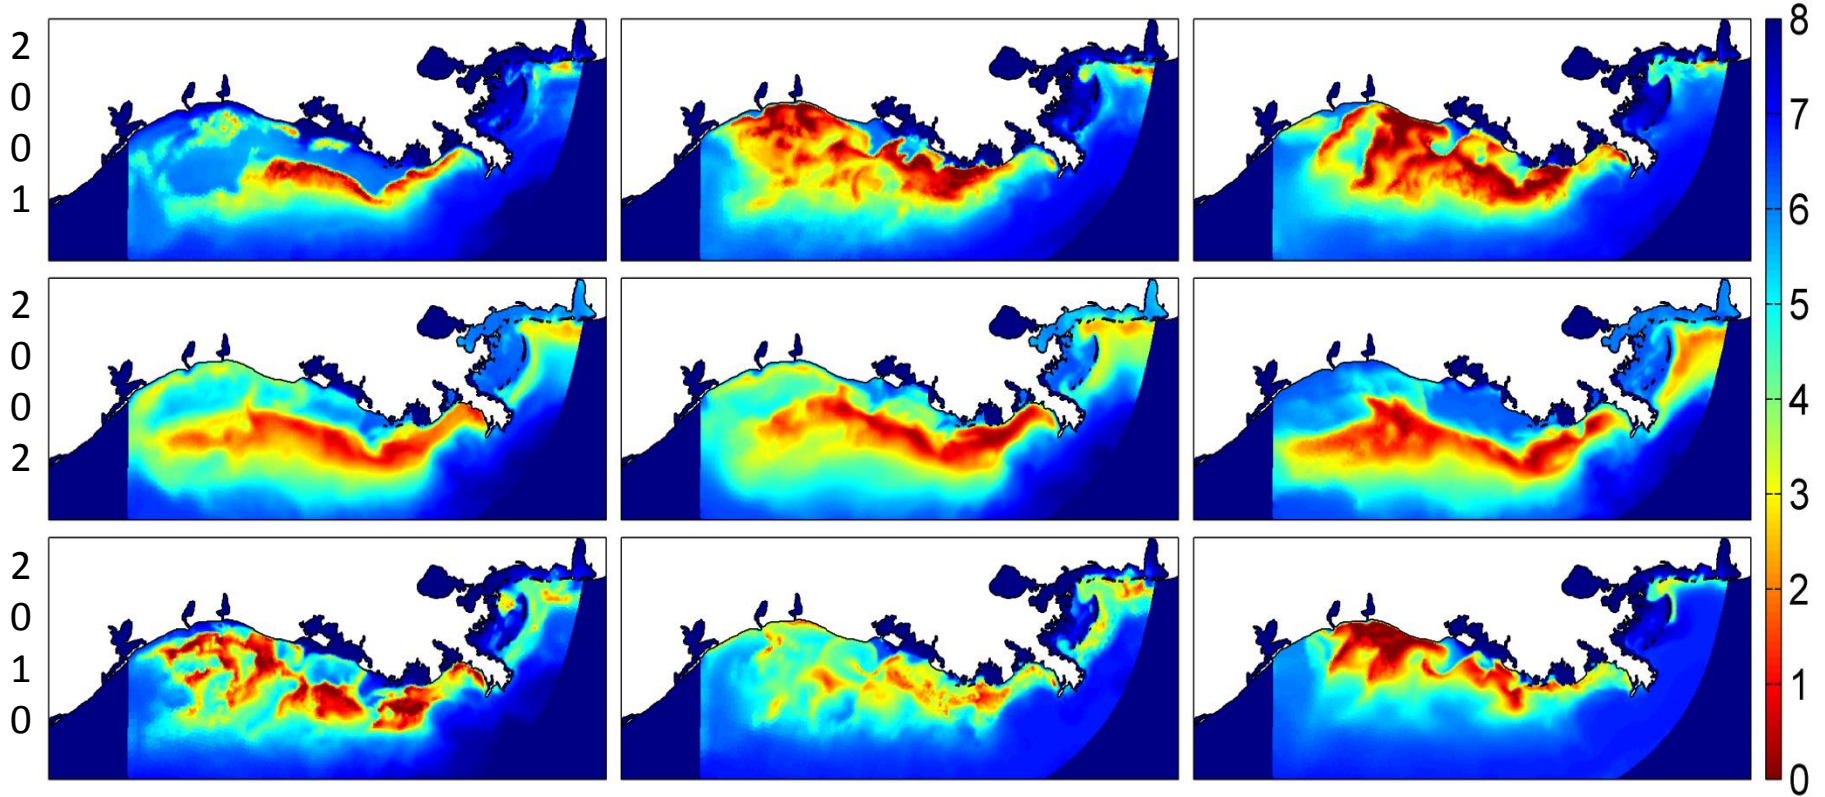

Dissolved Oxygen

June 15th

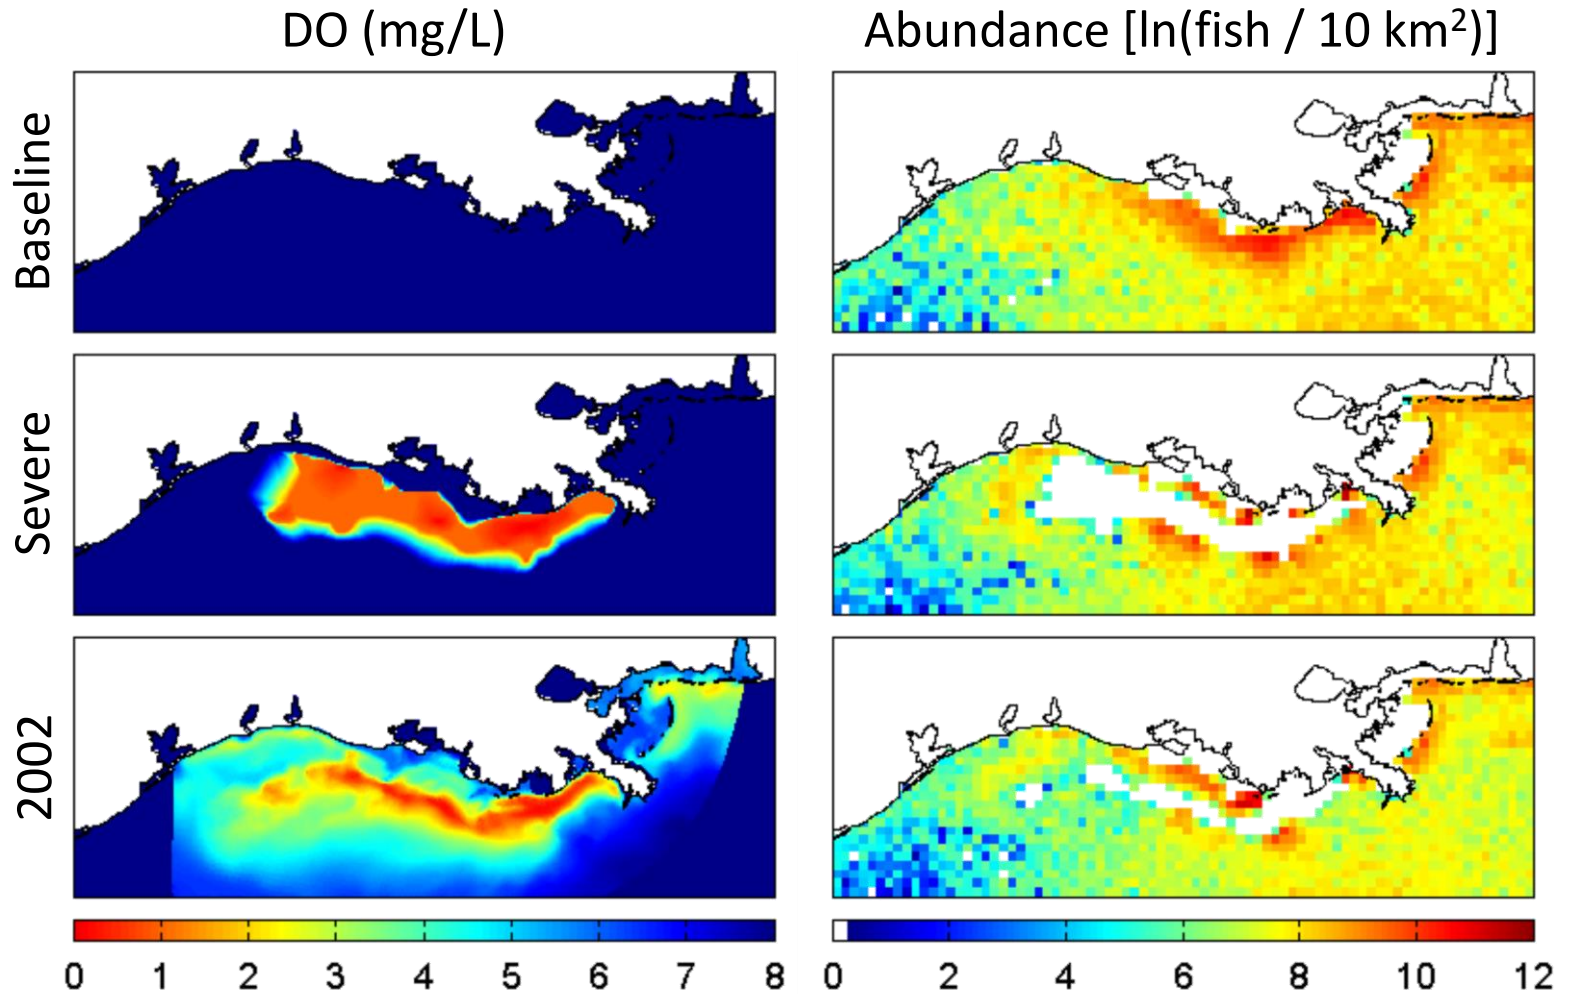

July 16th

August 16th

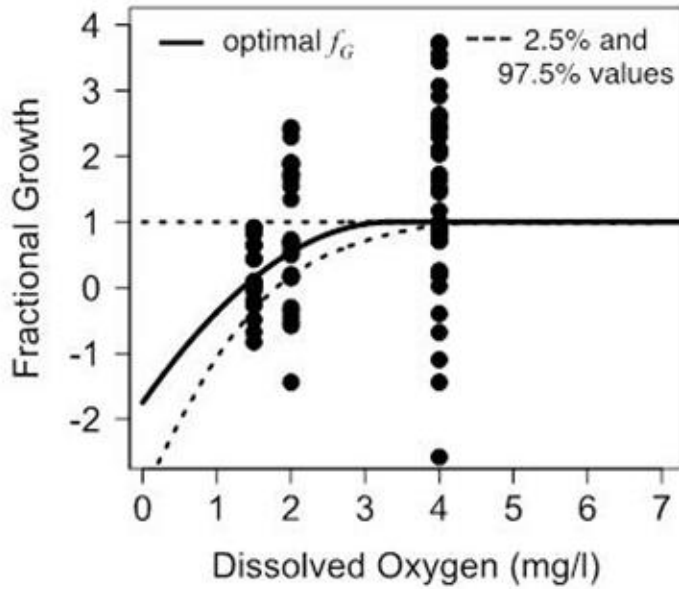

Avoidance

(July 16th)

DO Effects

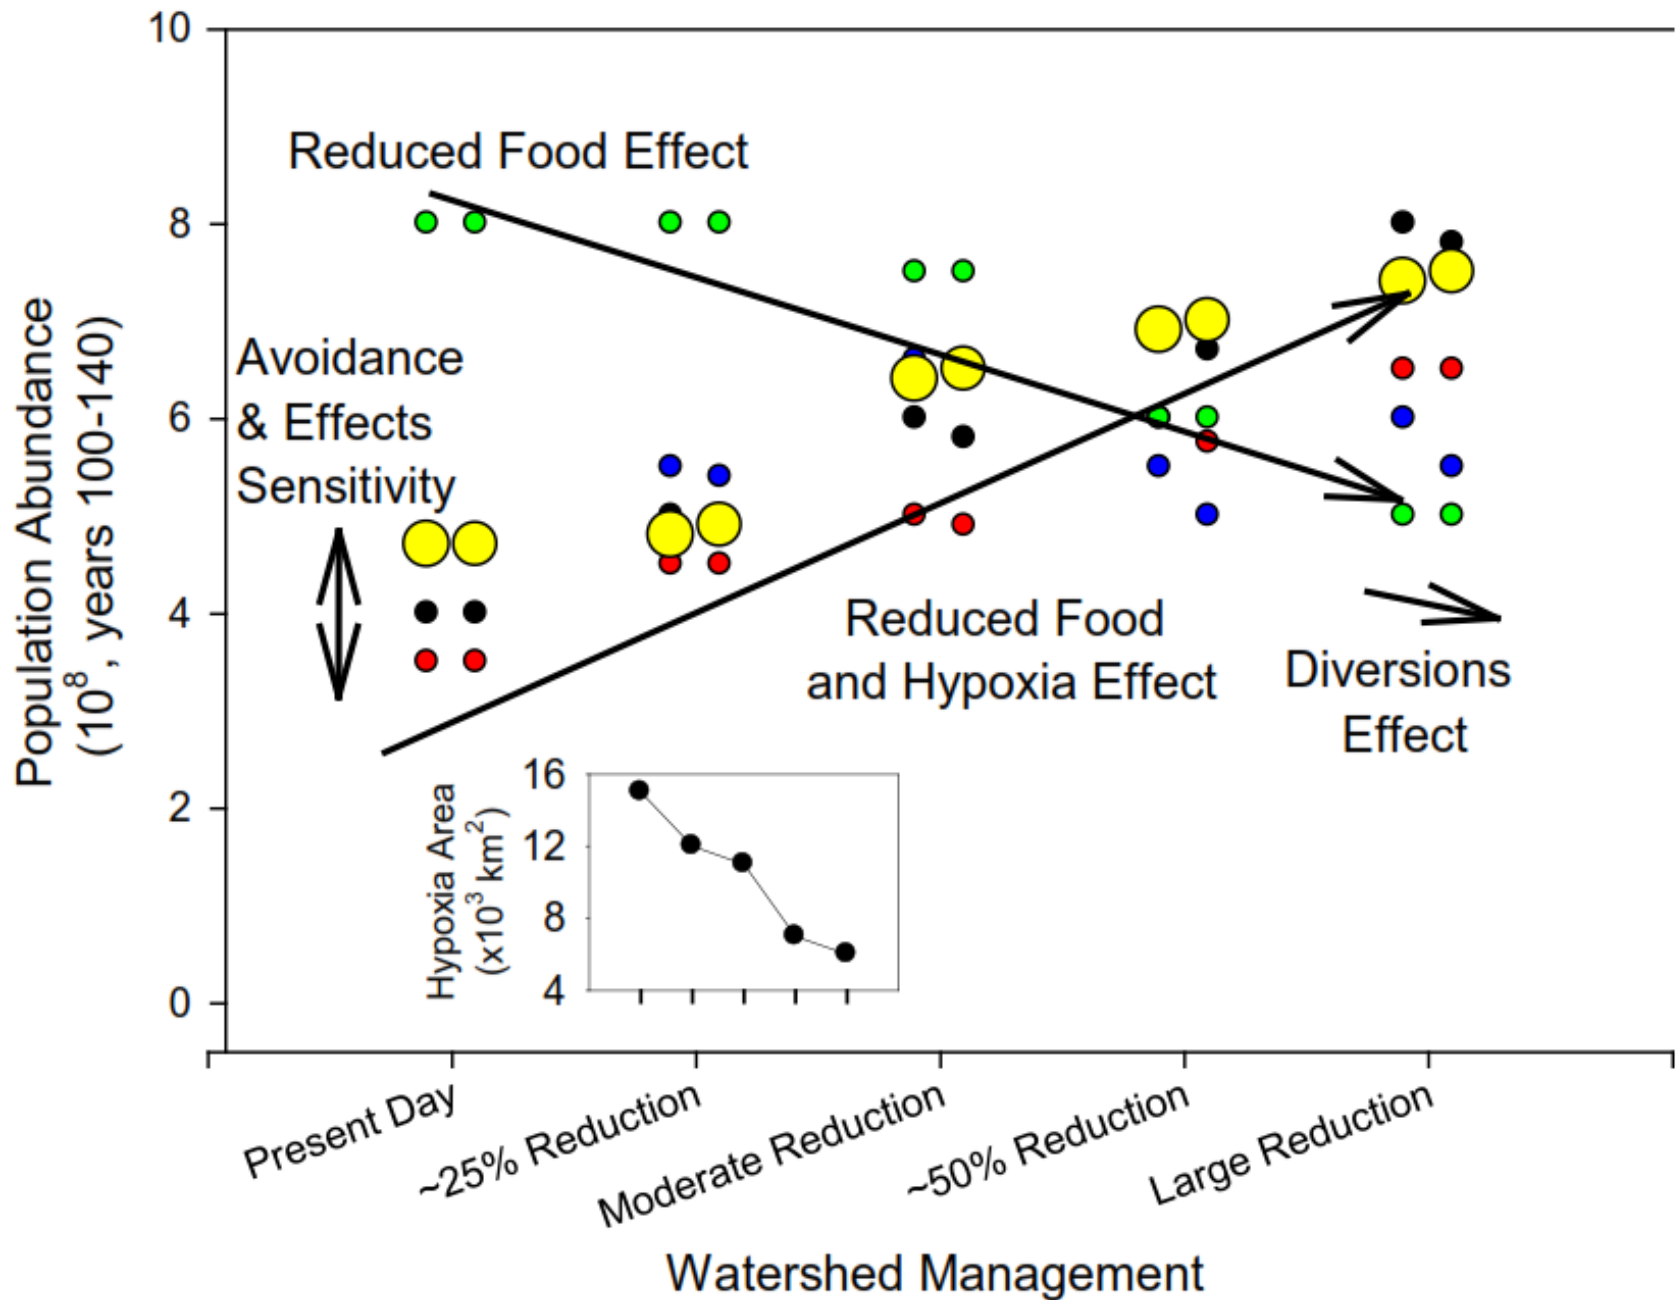

25% Reduction in Nutrients

PD: benefit if only croaker = +0.5 mg/L (↓25% area) feasible

Normoxia: best can be expected = +1.0 (↓50% area) not feasible

Informing Management

- Management Help Committee
 - Julie Anderson (Sea Grant); Doug Daigle (Task Force); John Lehrter (EPA); CPRA; Rex Caffey (economist)

- Application PI
 - Kevin Craig - NOAA
